

Success story: Avon and Dedisa Power Plants, South Africa

Ansaldo has successfully delivered the two power plants to Engie South Africa, that are the only IPPs using fossil fuel and providing an overall power in excess of 1 GW. The projects include two 15-year LTSAs matching the PPA duration. Construction was successfully completed in 2016 and on-time according to the contractual obligations, despite some force majeure events. The power plants can be easily converted to combined cycle as both sites have been designed and configured on phased construction criteria. During the construction, Ansaldo has employed up to 3000 local employees in different skills and has contributed to the local community social improvement with schools upgrades, training and safety awareness campaign.
